--R
$$\log\left(\frac{-2b\sqrt{ax+b} + (ax+2b)\sqrt{b}}{x}\right) 2\arctan\left(\frac{\sqrt{-b}\sqrt{ax+b}}{b}\right)$$
  
--R (1) 
$$\left[ \frac{\frac{+\sqrt{b}}{\sqrt{b}} \log\left(\frac{\sqrt{ax+b} - \sqrt{b}}{\sqrt{ax+b} + \sqrt{b}}\right)}{x}, - \frac{\frac{+\sqrt{b}}{\sqrt{b}} \arctan\left(\frac{\sqrt{-b}\sqrt{ax+b}}{b}\right)}{x} \right]$$
  
--R  
--R  
--R  
--E  
Type: Union(List Expression Integer,...)
```

Cleary Spiegel's first answer assumes $b > 0$:

```
(*)+≡  
 --S 11  
bb1:=1/sqrt(b)*log((sqrt(a*x+b)-sqrt(b))/(sqrt(a*x+b)+sqrt(b)))  
--R  
--R  
--R
$$\log\left(\frac{\sqrt{ax+b} - \sqrt{b}}{\sqrt{ax+b} + \sqrt{b}}\right)$$
  
--R  
--R (2) 
$$\frac{\frac{+\sqrt{b}}{\sqrt{b}} \log\left(\frac{\sqrt{ax+b} - \sqrt{b}}{\sqrt{ax+b} + \sqrt{b}}\right)}{\sqrt{b}}$$
  
--R  
--R  
--E  
Type: Expression Integer
```

So we try the difference of the two results

```
(*)+≡
--S 12
cc11:=aa.1-bb1
--R
--R
--R      +-----+   +-+
--R      \|a x + b - \|b           +-----+   +-+
--R      - log(-----) + log(-----)
--R      +-----+   +-+
--R      \|a x + b + \|b           x
--R
--R      (3) -----
--R                           +-+
--R                           \|b
--R
--R                                         Type: Expression Integer
--E
```

But the results don't simplify to 0. So we try some other tricks.

Since both functions are of the form $\log(f(x))/\sqrt{b}$ we extract the $f(x)$ from each. First we get the function from Axiom's first answer:

```
(*)+≡
--S 13
ff:=exp(aa.1*sqrt(b))
--R
--R      +-----+   +-+
--R      - 2b\|a x + b + (a x + 2b)\|b
--R
--R      (4) -----
--R                           x
--R
--R                                         Type: Expression Integer
--E
```

and we get the same form from Spiegel's answer

```
(*)+≡
--S 14
gg:=exp(bb1*sqrt(b))
--R
--R      +-----+   +-+
--R      \|a x + b - \|b
--R
--R      (5) -----
--R      +-----+   +-+
--R      \|a x + b + \|b
--R
--R                                         Type: Expression Integer
--E
```

We can change Spiegel's form into Axiom's form because they differ by the constant $a * \sqrt{b}$. To see this we multiply the numerator and denominator by $1 == (\sqrt{a * x + b} - \sqrt{b}) / (\sqrt{a * x + b} - \sqrt{b})$.

First we multiply the numerator by $(\sqrt{a * x + b} - \sqrt{b})$

```
(* )+≡
--S 15
gg1:=gg*(sqrt(a*x+b) - sqrt(b))
--R
--R
--R      +++ +-----+
--R      - 2\|b \|a x + b + a x + 2b
--R (6)  -----
--R          +-----+   ++
--R          \|a x + b + \|b
--R
--R                                         Type: Expression Integer
--E
```

Now we multiply the denominator by $(\sqrt{a * x + b} - \sqrt{b})$

```
(* )+≡
--S 16
gg2:=gg1/(\sqrt(a*x+b) - sqrt(b))
--R
--R
--R      +++ +-----+
--R      - 2\|b \|a x + b + a x + 2b
--R (7)  -----
--R          a x
--R
--R                                         Type: Expression Integer
--E
```

and now we multiply by the integration constant $a * \sqrt{b}$

```
(* )+≡
--S 17
gg3:=gg2*(a*sqrt(b))
--R
--R
--R      +-----+           ++
--R      - 2b\|a x + b + (a x + 2b)\|b
--R (8)  -----
--R          x
--R
--R                                         Type: Expression Integer
--E
```

and when we difference this with ff, the Axiom answer we get:

```
(*)+≡
--S 18      14:87a Schaums and Axiom differ by a constant
ff-gg3
--R
--R      (9)  0
--R
--E                                         Type: Expression Integer
```

So the constant of integration difference is $a * \sqrt{b}$

Now we look at the second equations. We difference Axiom's second answer from Spiegel's answer:

```
(*)+≡
--S 19
t1:=aa.2-bb1
--R
--R
--R      +-----+   +-+
--R      +---+   \|a x + b - \|b      +---+ +-----+
--R      - \|- b log(-----) - 2\|b atan(-----)
--R
--R      +-----+   +-+
--R      \|a x + b + \|b
--R
--R      (10)  -----
--R
--R
--R
--R                                         +---+ +-+
--R                                         \|- b \|b
--R
--E                                         Type: Expression Integer
```

and again they do not simplify to zero. But we can show that both answers differ by a constant because the derivative is zero:

```
(*)+≡
--S 20
D(t1,x)
--R
--R      (11)  0
--R
--E                                         Type: Expression Integer
```

Rather than find the constant this time we will differentiate both answers and compare them with the original equation.

```
(*)+≡
--S 21
target:=1/(x*sqrt(a*x+b))
--R
--R
--R      1
--R      (12)  -----
--R           +-----+
--R           x\|a x + b
--R
--E                                         Type: Expression Integer
```

and we select the second Axiom solution

```
(*)+≡
--S 22
aa2:=aa.2
--R
--R
--R      +---+ +---+
--R      \| - b \|a x + b
--R      2atan(-----)
--R                  b
--R      (13)  - -----
--R                  +---+
--R                  \| - b
--R
--E                                         Type: Expression Integer
```

take its derivative

```
(*)+≡
--S 23
ad2:=D(aa2,x)
--R
--R
--R      1
--R      (14)  -----
--R           +-----+
--R           x\|a x + b
--R
--E                                         Type: Expression Integer
```

When we take the difference of Axiom's input and the derivative of the output we see:

```
(*)+≡
--S 24
ad2-target
--R
--R (15) 0
--R
--E                                         Type: Expression Integer
```

Thus the original equation and Axiom's derivative of the integral are equal.

Now we do the same with Spiegel's answer. We take the derivative of his answer.

```
(*)+≡
--S 25
ab1:=D(bb1,x)
--R
--R
--R (16)  -----
--R           +-----+   +-+
--R           \|a x + b + \|b
--R           +--+ +-----+   2
--R           x\|b \|a x + b + a x + b x
--R
--E                                         Type: Expression Integer
```

and we difference it from the original equation

```
(*)+≡
--S 26      14:87b Schaums and Axiom differ by a constant
ab1-target
--R
--R (17) 0
--R
--E                                         Type: Expression Integer
```

Thus the original equation and Spiegel's derivative of the integral are equal.

So we can conclude that both second answers are correct although they differ by a constant of integration.

5 [1]:14.88 $\int \frac{dx}{x^2\sqrt{ax+b}}$

$$\int \frac{1}{x^2\sqrt{ax+b}} = -\frac{\sqrt{ax+b}}{bx} - \frac{a}{2b} \int \frac{1}{x\sqrt{ax+b}}$$

(*)+≡
)clear all

--S 27
aa:=integrate(1/(x^2*sqrt(a*x+b)),x)
--R
--R
--R (1)
$$\frac{a x \log\left(\frac{2 b \sqrt{a x + b} + (a x + 2 b) \sqrt{b}}{x}\right) - 2 \sqrt{b} \sqrt{a x + b}}{2 b x \sqrt{b}}$$

--R [-----,
--R
$$\frac{a x \operatorname{atan}\left(\frac{\sqrt{-b} \sqrt{a x + b}}{b}\right) - \sqrt{-b} \sqrt{a x + b}}{b x \sqrt{-b}}$$

--R -----]
--R
--R
--R Type: Union(List Expression Integer,...)
--E

In order to write down the book answer we need to first take the integral which has two results

```
(*)+≡
--S 28
dd:=integrate(1/(x*sqrt(a*x+b)),x)
--R
--R
--R
$$\log\left(\frac{-2b\sqrt{ax+b} + (ax+2b)\sqrt{b}}{x}\right) \quad 2\arctan\left(\frac{\sqrt{-b}\sqrt{ax+b}}{b}\right)$$

--R (2) [-----, - -----]
--R
$$\frac{\sqrt{b}}{\sqrt{-b}}$$

--R
--R                                         Type: Union(List Expression Integer,...)
--E
```

and derive two results for the book answer. The first result assumes $b > 0$

```
(*)+≡
--S 29
bb1:=-sqrt(a*x+b)/(b*x)-a/(2*b)*dd.1
--R
--R
--R
$$-\frac{2b\sqrt{ax+b} + (ax+2b)\sqrt{b}}{2bx\sqrt{b}} - 2\sqrt{b}\sqrt{ax+b}$$

--R (3) -----
--R                                         Type: Expression Integer
--E
```

and the second result assumes $b < 0$.

```
(*)+≡
--S 30
bb2:=-sqrt(a*x+b)/(b*x)-a/(2*b)*dd.2
--R
--R
--R
$$(4) \frac{a x \operatorname{atan}\left(\frac{\sqrt{-b} \sqrt{a x+b}}{b}\right)-\sqrt{-b} \sqrt{a x+b}}{b x \sqrt{-b}}$$

--R
--R
--E                                         Type: Expression Integer
```

So we compute the difference of Axiom's first result with Spiegel's first result

```
(*)+≡
--S 31
cc11:=bb1-aa.1
--R
--R
$$(5) - a \log\left(\frac{2 b \sqrt{a x+b}+(a x+2 b) \sqrt{b}}{x}\right)$$

--R
$$+ - a \log\left(\frac{-2 b \sqrt{a x+b}+(a x+2 b) \sqrt{b}}{x}\right)$$

--R
--R /
--R
$$2 b \sqrt{b}$$

--R
--E                                         Type: Expression Integer
```

we compute its derivative

```
(*)+≡
--S 32
D(cc11,x)
--R
--R
$$(6) 0$$

--R
--E                                         Type: Expression Integer
```

and we can see that the answers differ by a constant, the constant of integration. So Axiom's first answer should differentiate back to the target equation.

```
(*)+≡
--S 33
target:=1/(x^2*sqrt(a*x+b))
--R
--R
--R      1
--R      (7)  -----
--R      2 +-----+
--R      x \|a x + b
--R
--E                                         Type: Expression Integer
```

We differentiate Axiom's first answer

```
(*)+≡
--S 34
ad1:=D(aa.1,x)
--R
--R
--R      +-+ +-----+ 2
--R      (a x + 2b)\|b \|a x + b + 2a b x + 2b
--R      (8)  -----
--R      3      2 2 +-----+ 2 4      3      2 2 +-+
--R      (2a b x + 2b x )\|a x + b + (a x + 3a b x + 2b x )\|b
--R
--E                                         Type: Expression Integer
```

and subtract it from the target equation

```
(*)+≡
--S 35
ad1-target
--R
--R      (9)  0
--R
--E                                         Type: Expression Integer
```

and now we do the same with first Spiegel's answer:

```
(*)+≡
--S 36
bd1:=D(bb1,x)
--R
--R
--R      +-+ +-----+ 2
--R      (- a x - 2b)\|b \|a x + b + 2a b x + 2b
--R      (10)  -----
--R      3      2 2 +-----+ 2 4      3      2 2 +-+
--R      (2a b x + 2b x )\|a x + b + (- a x - 3a b x - 2b x )\|b
--R
--E                                         Type: Expression Integer
```

and we subtract it from the target

```
(*)+≡  
--S 37  
bd1-target  
--R  
--R (11) 0  
--R

so we know that the two first answers are both correct and that their integrals differ by a constant.

Now we look at the second answers. We difference the answers and can see immediately that they are equal.
